LEGEND

```
R/W: R = Read-Only
R/W = Read from float or integer format, Write to integer format only
W = Write-Only
NV: NV = Value is stored in non-volatile memory
V = Value is volatile

SQD ID 1517x: Y = Parameter is valid for this ID
N = Parameter is invalid for this ID
Scale Reg: V = Voltage
W = Power
E = Energy
I = Current
<val> = scale is fixed at value shown. If no value shown, it is assumed to be 0.
```

Modbus Addresses

There are 2 Modbus addresses associated with the BCM2 - one address for each set of 2 CT strips and set of 4 AUX inputs. The primary Modbus address is set with the main PCB DIPswitches; The secondary address is always the primary address + 1. The Modbus Map detailed here is repeated *in it's entirety* for both addresses.

Supported Commands

Read Holding Register (03h) Preset Single Register (06h) Preset Multiple Registers (10h) Report Slave ID (11h)

This will include the following info in the "Additional Data" area:

"Veris Model Exxx Branch Circuit Monitor, S/N=0x12345678, Location="<location string>""

Integer vs. Floating Point Registers

Integer format registers represent the data as 16 bit signed integer values. Float format registers represent the same data as 32-bit floating point values.

Floats

All floating point variables are read-only.

Floating point registers are packed as follows:

| Float | MSB | BYTE3 | BYTE2 | LSB |
|------------|-----|-------|-------|-----|
| Modbus MSW | MSB | LSB | | |
| Modbus LSW | | | MSB | LSB |

Example:

For a floating point value of 3.14159, the encoded 32-bit float value is 0x40490FD0.

Modbus MSW = 0x4049Modbus LSW = 0x0FD0

Integers

Integer format registers must be used in conjunction with their associated Scale registers.

The Scale Registers represent the <u>exponent</u> of the associated values and are used in conjunction with the integer registers to create the final floating-point results.

Example:

integer register = 27 scale register = -2 final result = $27 * 10^{(-2)} = 0.27$

Note: If a Scale register is not listed for a parameter, it is assumed to be 0.

32-bit integer values, such as KWH, are packed as follows:

 32-bit integer
 MSB
 BYTE3
 BYTE2
 LSB

 Modbus MSW
 MSB
 LSB

 Modbus LSW
 MSB
 LSB

Example:

For a 32-bit value of 0x12345678. Modbus MSW = 0x1234Modbus LSW = 0x5678

Note that the Scale register for Energy (E) is applied only to the final 32-bit result.

For the Current Scales (I), Power Scales (W) and Energy Scales (E) for 1 phase, 2 phase and/or 3 phase Modbus Point Maps, make sure you are using the correct Scale value

Example:

integer register #1336 (Current Meter 1) = 10

scale register #1000 = -1 final result = $10 * 10^{(-1)} = 1.0$

Model Differences

The Device ID register (register #5) indicates which registers in the map are valid and invalid Invalid channels report the following values:

Integer registers: 0x8000 (32768) Float registers: 0x7FC00000 (NaN)

| Section | #Registers |
|---------|------------|
| Common | 760 |
| 1PH | 1470 |
| 2PH | 1302 |
| 3PH | 1120 |
| TOTAL | 4652 |

Below maps the Device ID to Model Series:

15170 = Model C, current only on all channels, no voltage

15171 = Model B, current only on branch channels, power on AUX channels plus voltage

15172 = Model A, current and power on all channels plus voltage

| Int Reg | Float Reg | LSW | | V Channel | Model (A,B,C) | Decoriation | Scale | Dongo | Default |

Breaker Sizes (Amps)
Setting the breaker size to "0" will disable all alarms for that channel.

Alarm Timers (seconds)
These timers control entry into a latching alarm state. A return to a non-alarm state is instantaneous.

All channels use the same global timers.

Latching Alarm On Time applies to all Latching Alarms.

The parameter measurement rate is expected to be around 2.5 secs, which will limit the effective resolution of these timers.

| 165 | R/W | NV | All | A,B,C | High-High Latching Alarm Time Delay | 0-32767 | 10 |
|-----|-----|----|-----|-------|---|---------|----|
| 166 | R/W | NV | All | A,B,C | High Latching Alarm Time Delay | 0-32767 | 10 |
| 167 | R/W | NV | All | A,B,C | Low Latching Alarm Time Delay | 0-32767 | 10 |
| 168 | R/W | NV | All | A,B,C | Low-Low Latching Alarm Time Delay | 0-32767 | 10 |
| 169 | R/W | NV | All | A,B,C | Latching Alarm ON Time (when current is above Low-Low | 0-32767 | 10 |
| | | | | | alarm & ON Time elapses then ON state is declared for | | |
| | | | | | all latching alarms, ON State enables Alarm Time Delays) | | |
| 170 | R/W | NV | All | A,B,C | Latching Alarms time until OFF state declared (current is below | 0-32767 | 30 |
| | 1 | | | | Low-Low alarm and a ON state was declared) | | |

Alarm Thresholds

All values are expressed as %breaker-size.

All channels use these same global values.

An entry of 0% for any threshold disables that alarm for all channels.

All Thresholds are scaled by -1 to increase the precision by 1 decimal point

Hysteresis only applies to Non-Latching Alarms

| 171 | | R/W | NV | All | A,B,C | High-High Latching Alarm Threshold | -1 | 0-1000 | 700 |
|-----|---|-----|----|-----|-------|--|----|--------|-----|

L-L Voltage Alarm Timers (seconds)

These timers control entry into an alarm state. A return to a non-alarm state is instantaneous.

All channels use these same global timers.

Note that the parameter measurement update rate is 1.6 secs, which will limit the effective resolution of these timers.

| 236 | R/W | NV | A,I | ,B | Overvoltage Alarm Timer | 0-32767 | |
|-----|-----|----|-----|----|--------------------------|---------|--|
| 237 | R/W | NV | A,I | ,B | Undervoltage Alarm Timer | 0-32767 | |

L-L VOLTAGE ALARM THRESHOLDS

All voltage alarm thresholds are expressed as Volts.

All Line-to-Line voltage channels use the same thresholds

An entry of 0 for any threshold disables that alarm for all channels.

Hysteresis is scaled by -1 to increase the precision by 1 decimal point

Hysteresis only applies to Non-Latching Alarms

| 238 | | R/W | NV | A,B | Overvoltage Alarm Threshold | 244 | 0-32767 | |
|-----|--|-----|----|-----|---|-----|---------|--|
